

SALRO-50 RESIDENTIAL REVERSE OSMOSIS UNIT

SALRO-50 reverse osmosis system offers an additional level of quality to your drinking water. Water is processed through a series of filters and a membrane and then stored in pressurized plastic storage tank. On demand, the water is forced out of the storage tank through post filter and then a special sink mounted drinking water faucet ready for your use. As water is drawn out of the storage tank, the R.O. automatically turns itself on and processes enough water to refill the tank, ensuring that fresh, clean water always available.

SALRO-50 SPECIFICATIONS

Model SALRO-50

Capacity 50 GPD

5 Treatment Stages:

1st stage : 5-micron PP sediment filter

2nd stage : Granular activated carbon filter

3rd stage : Block carbon filter
